                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The two forms of VEFG (Q10797 and Q10917) which arise through Cd different message splicing, have different properties. In partic. CC hVEGF121 does not bind to heparin leaving more of the protein free to bind to VEGF receptor and increase the half-life and distribution of the protein in circulation, whereas hBEGF165 binds heparin strongly. Cran be used for angiogenesis and re-endothelialisation of inner vascular surfaces in wound healing, e.g. treatment of full-cran because in wound healing, e.g. treatment of full-cran burner, in surgery, in balloon angioplasty and for the in cutturing of endothelial cells. Hybrid growth factors of PDGF and VEGF can exhibit a mitogenic profile between each factor and cc can be used for wound healing or as inhibitors of angiogenesis for CC vegr preventing the growth of tumours.

CC VEGF analogues in which CYS residues are substd. are more stable.

CC VEGF analogues in which CYS residues are substd. are more stable.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

Alternative splicing of the sequence gives a shorter coding sequence which encodes the 121 amino acid hVEGF (see R42607). The full-length coding sequences can

                                                                                                                           This is the amino acid sequence of the vascular permeability factor (VPF), a member of the growth factor family. Several VPF types are known having 121, 155, 189 or 206 amino acids. This sequence was used to generate a series of overlapping peptides having 10 residues which were used to raise antibodies against the VPF peptide. The two peptides w13578-9 generated the greatest antibody signal against the VPF protein. These clones were used to manufacture hybridomas producing monoclonal antibodies which are useful for diagnosis and treatment of cancers and

The vaccine can be used for treating cancers, glaucoma, eye tumours, trachoma, psoriasis, granuloma, hypertrophic scars, gost-crystalline fibrosis and senile disk muscular degeneration. A preferred protein for use in the vaccine is human VEGE/VPF121,

                                                                                                                     R93977;
                                                                                                                                   R93977 standard; protein; 121 AA.
                                                                                                                                                                                                                                                                                              This sequence represents the human vascular permeability factor (hVPF). The monoclonal antibody of the invention (MVI01) reacts with this hVPF sequence. MVI01 does not, however, react with a peptide composed of ten sequences ive residues of this sequence starting from an odd number from the N-terminus of this sequence (e.g. residues 1-10, residues 5-14, residues 47-56 etc.). The antibody can be used for diagnosis and treatment of cancer and other diseases. When it is used as an anti-cancer agent, it is preferably in the form of a chimeric or humanised antibody.
                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                               Monoclonal antibody reacting with human vascular permeability factor - useful for treatment and diagnosis of cancer and other diseases

                                                                          The patent discloses a vascularisation controlling vaccine comprising a cell growth factor which specifically promotes growth of endothelial cells. The vaccine is typically unimmunotherapy to remedy diseases caused by vascularisation, such as solid tumours, and to control the onset and recurrence of such diseases. Typical growth factors include vascular permeability factor (VPF) and vascular endothelial growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence represents VPF121. The patent relates to three ne short peptides derived from this sequence (see R93978 - R93986 to monoclonal antibodies raised against them which are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI;
                                                                                                                                                                                                                                                                                                           Vascularisation-controlling vaccine - contains endothelial cell growth factor, used in the immunotherapy of solid tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  31-MAY-1996;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            vascular endothelial growth factor; VEGF; permeability; VPF;
immunotherapy; vaccine; cancer; vascularisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    31-MAR-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         W40597;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Partial peptide(s) of VPF121 and monoclonal antibodies - anticancer agents

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  24-JUL-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes the novel preparation of biologically active dimers of recombinant human growth factors of the cysteine knot family starting from cellular inclusion bodies. Such dimers are are useful in pharmaceutical compositions and the method provides yields of 31-39,7%, in examples, compared with about 10% for the conventional method (see Biochemistry, 28 (1989) 2956). Y08278-Y08301 are human growth factor protein fragments used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           W56693 standard; Protein; 145

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This represents a vascular endothelial growth factor-145 (VEGF145) which CC can be used to stimulate vascular cell proliferation. Polynucleotides encoding VEGF145 are useful for treatment of cardiovascular or vascular CC disease in mammalis, especially humans. They are also useful for enhancing CC vascular cell proliferation or to enhance endothelialization of diseased CC vascular cell proliferation or to enhance endothelialization of diseased CC vessels (especially re-endothelialization after angioplasty) in mammals. CC vEGF145, which hinds as weakly as VEGF165 to heparin, binds much better CC vEGF145 to the extracellular matrix (ECM). However, unlike VEGF189, CC This combination of properties render VEGF145 the only known VEGF variant CC that is secreted from producer cells and binds efficiently to ECM. CC that is secreted from producing cells retaining at the same time ECM that is secreted from producing cells retaining at the same time ECM combination of properties render VEGF145 the only known VEGF variant CC that is secreted from producing cells retaining at the same time ECM components along the path of diffusion. This ECM bound gool will consiste slowly allowing a longer period of activity. Additionally, the unlike VEGF forms such as VEGF121 thereby giving it a longer half-life.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes the novel preparation of biologically active dimers of recombinant human growth factors of the cysteine knot family starting from cellular inclusion bodies. Such dimers are are useful in pharmaceutical compositions and the method provides yields of 31-39.7%, in examples, compared with about 10% for the conventional method (see Biochemistry, 28 (1989) 2956). Y08278-Y08301 are human growth factor protein fragments used in the method of the invention.
                                                                                                             Novel methods and compositions for the prevention and treatment microvascular angiopathies by administration of angiogenic factor as vascular endothelial growth factor (VEGF) - ^{\circ}
 The present sequence represents native human vascular endothelial growth factor (VEGF) 145. VEGF is an anglogenic factor. VEGF proteins are used for the prevention or repair of injury to blood vessels or associated nonvascular tissues (served by the blood vessels) and for the prevention
factor (VEGF) 145. VEGF is an an for the prevention or repair of nonvascular tissues (served by t

The proteins methods may also be used for the prevention and treatment of kidney diseases associated with injury to, or atrophy of, the vasculature of the glomerulus and interstitium. Conditions which may be treated include haemolytic uremic syndrome, toxic shock syndrome, venom exposure, chemical exposure, preclampsia, thrombotic thrombocytopenia purpura, disseminated intravascular coagulation, sechemic bowel disease, transient ischemic attacks, stroke, hypoxia or hypercappia or fibrosis arising from lung endothelium injury, acute respiratory distress syndrome, toxic alveolar injury, pneumonia, pulmonary emboli, birth prematurity diseases, organ transient fees of the protections, hypersensitivity, autoimmune diseases, organ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vascular endothelial growth factor; human; angiogenesis; VGEF; capillary formation; hypertension; treatment; kidney; CNS; stroke; meningitis; central nervous system; tumour; infection; bone growth hypoxia; hypercapnia; fibrosis; inflammatory bowel disease; diarrhoea; allografts; cardiac valve.
Administering vascular endothelial growth factor (VGEF) can be for treating hypertension (especially salt-dependent hypertension Administration of VGEF promotes angiogenesis and/or vascular or capillary permeability. The method is also useful in treating disorders related to abnormal transport of solutes across endot

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bovine folliculo stellate cells were used in the process of cottaining cDNA encoding bVEGF (164 amino acids from). The probes represented in Q10806 and -07 were used in the screening procedures. See Q10796 for bVEGF120 which is obtained by alternative splicing of this sequence, i.e. bases 342-473 (amino acids 115-159) are spliced. The product can be used for anyiogenesis and re-endothelialisation of inner vascular surfaces in wound healing, e.g. treatment of full-culters, burns, in surgery, in balloon angioplasty and for the in culturing of endothelial cells. Hybrid growth factors of pDGF can be used for wound healing or anyiogenesis for can be used for vound healing or as inhibitors of angiogenesis for ce.g. preventing the growth of tumours.

CC eg. preventing the growth of tumours.

        The sequence of Q44260 contains an open reading frame corresponding to the 165 amino acid human vascular endothelial cell growth factor (hVEGF-165, see R38921). Alternative splicing of the sequence gives a shorter coding sequence which encodes the 121 amino acid hVEGF (see R42607). The full-length coding sequences be generated using PCR with human foetal vascular smooth muscle poly-A+ RNA as template.
                                                                                                                                                                                                                                                          27-JUL-1989;

         W31085-W31096 are vascular endothelial growth factor (VEGF) variants. Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FDT-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis
 to the useful is desi
                                                                                                                                                                          Vascular endothelial cell growth factor variant - used candidates having agonistic or antagonistic properties to KDR and/or FLT receptor binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         substitution; drug screening; kinase domain binding FMS-like tyrosine kinase binding region; FLT-1; dritesting; vasculogenesis; angiogenesis; metastasis;

Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FUP-1). All indicated residues are preferably replaced with alamine. TME variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants
                                                                                                                                                                                                                                                       Vascular endothelial cell growth factor variant - used candidates having agonistic or antagonistic properties to KDR and/or FLT receptor binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           substitution; drug screening; kinase domain binding region; KDI FMS-like tyrosine kinase binding region; FLT-1; drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   W31086;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      KDR and/or FIT-1 receptors. Compositions identified may be for treating indications where vasculogenesis or angiogenesis ired for treatment of an underlying disease state. This sequence is not given in the specification, it was created claimed specified mutant of wild-type mature VEGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             165

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   C w31085-w31096 are vascular endothelial growth factor (VEGF) variants.
C Especially preferred modifications comprise mutations in the kinase domain binding region (RDR) or the FMS-like tyrosine kinase binding region (FUT-1). All indicated residues are preferably replaced with calanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties of with respect to KDR and/or FLT receptor binding, by measuring the ceffect the candidate has on the binding properties of the variants of the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis cuseful for treating indications where vasculogenesis or angiogenesis of the desired for treatment of an underlying disease state.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FLT-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or anglogenesis is desired for treatment of an underlying disease state.

N.B. This sequence is not given in the specification, it was created from a claimed specified mutant of wild-type mature VEGF.
                                                                                                                                                                                                                                                                                                                                         W31089;

Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FLT-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis is desired for treatment of an underlying disease state.

N.B. This sequence is not given in the specification, it was created from a claimed specified mutant of wild-type mature VEGF.

C Especially preferred modifications comprise mutations in the kinase of domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FUT-1). All indicated residues are preferably replaced with claimine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the ceffect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis of is desired for treatment of an underlying disease state.

N.B. This sequence is not given in the specification, it was created to the KDR and claimed specified mutant of wild-type mature VEGF.

All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FTT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FTT-1 receptors. Compositions identified may be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        w31085-w31096 are vascular endothelial growth factor (VEGF) variants. Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FTG-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FIG receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FIG-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis is desired for treatment of an underlying disease state.

N.B. This sequence is not given in the specification, it was created from a claimed specified mutant of wild-type mature VEGF.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FLT-1). All indicated residues are preferably replaced with alarine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis useful for treatment of an underlying disease state.

N.B. This sequence is not given in the specification, it was created from a claimed specified mutant of wild-type mature VEGF.

Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FLT-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis is desired for treatment of an underlying disease state.
                                                                                                                      Vascular endothelial growth factor variant used

Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (KDR) or the FMS-like tyrosine kinase binding region (FLT-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FIT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FIT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis is desired for treatment of an underlying disease state.

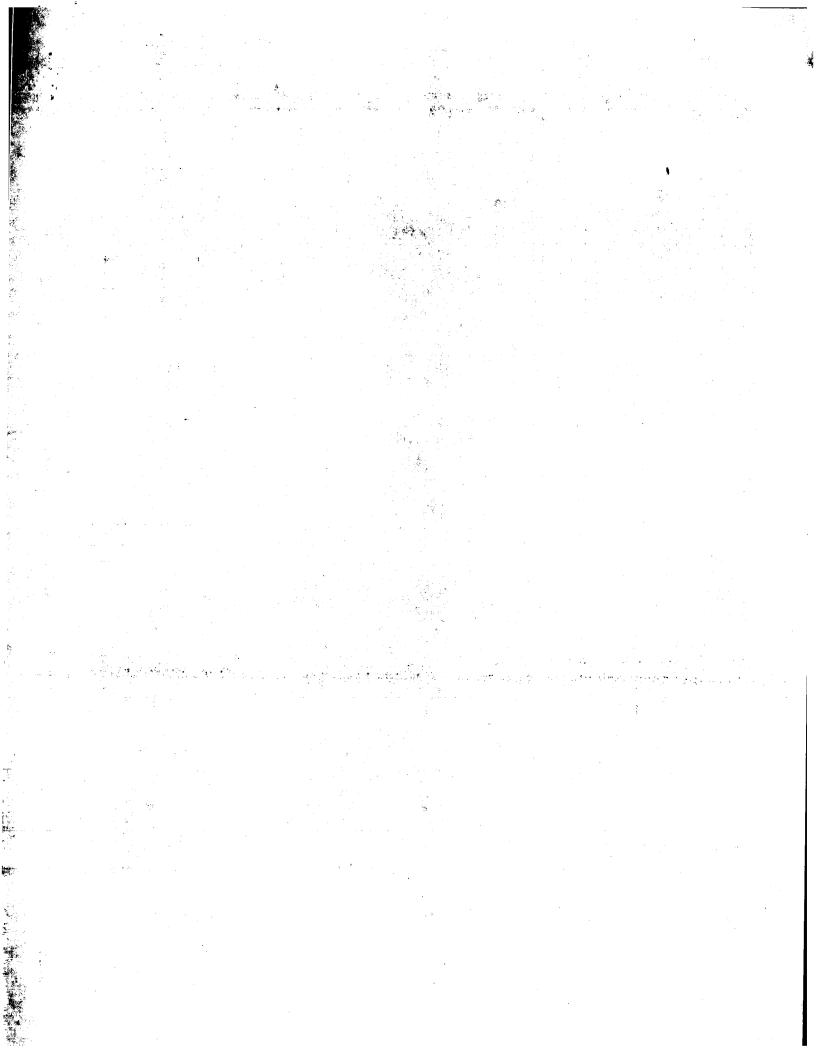

N.B. This sequence is not given in the specification, it was created from a claimed specified mutant of wild-type mature VEGF.
                                                                                      Query Match 86.9%;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Receptor protein tyrosine kinase; assay; screening; agonist; activator; vascular permeability; angiogenesis; tumour thera wound healing; vascular endothelial growth factor; neuroepithelial tyrosine kinase.
                                                                Mutant
                                                                                                                                                                                                                                                                                                                              Receptor protein tyrosine kinase assays can be used to identify inhibitors of receptor tyrosine kinases which can be utilised for inhibiting vascular permeability or for preventing angiogenesis e.g. in tumour therapy; or the assays can be used to induce vascular permeability or to enhance angiogenic activity, e.g., in wound healing. This mutant vascular endothelial growth factor comprises a K73S substitution and was identified in an assay involving the receptor protein neuroepithelial tyrosine kinase (NYK). It is a receptor agonist.

This mutant vascular endothelial growth factor comprises an HillG substitution and was identified in an assay involving the receptor protein neuroepithelial tyrosine kinase (NYK). It is a receptor agonist.
                                                                                                                                                       Receptor protein tyrosine kinase; assay; screening; agonist; activator; vascular permeability; angiogenesis; tumour thera wound healing; vascular endothelial growth factor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New receptor protein tyrosine kinase assays inhibitors or activators which can be used i angiogenesis or vascular permeability

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                identify inhibitors of receptor tyrosine kinases which can be utilised for inhibiting vascular permeability or for preventing angiogenesis e.g in tumour therapy; or the assays can be used to induce vascular permeability or to can be used to induce vascular permeability or to enhance angiogenic activity, e.g., in wound healing. This mutant vascular endothelial growth factor comprises a G117V substitution and was identified in an assay involving the receptor protein neuroepithelial tyrosine kinase (NYK). It is a receptor agonist.
                                                                                                                                 LUDW-) LUDWIG

Multiple cDNAs encoding alternative forms of the VEGF A-subunit were amplified using PCR primers as in Q23049 and Q23050. Three sets of clones were identified. Clone #12 encoded the 164 amino acid secreted form of VEGF A-subunit (see R23347). Clone #14 has a 135 bp deletion and thus encodes a 120 amino acid form and Clone #16 has a

The deleted region lies between the second base of the Asn140 codon and the third base of the Arg184 codon. The 120 amino acid mature protein has Asn140 converted to Lys140. See also Q23038-Q23059.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           27

                                                                                                                                                                                             The present sequence represents a rat vascular endothelial growth factor II (VEGF II) A subunit variant with a conversion of Asn 140 to Lys 140, and the deletion of His 141 to Arg 184 from the wild-type given in w53639. The present invention describes: (1) a mammalian VEGF II protein comprising an A subunit from w53639, w53640 or w53641, and a B subunit from w53639, w53639 or the first 115-135 amino acids of w53638; and (2) a mammalian VEGF comprising a heterodimer or homodimer of B subunits. The growth factor is used for promoting vascular development and repair and for promoting tissue repair.

N.B. The present sequence is not given inthe specification but is derived from Fig 5 as stated in the claim.

                                                                                                                                                                                                                                                                                                                                                              This is the amino acid sequence of a 146 amino acid residue A subunit of vascular endothelial cell growth factor (VEGF). The invention relates to a purified and isolated VEGF C subunit amino acid sequence Y57025. VEGF exists in various microheterogenous forms, and is useful for the promotion of vascular development and repair. The invention also relates to human VEGF heterodimers AC or EC and homodimer CC, where A, B and C are subunit amino acid sequences. The VEGF AC, BC or CC amino acid sequences can be used in a tissue repairing pharmaceutical composition. The novel growth factors are useful for the production or coverage of artificial blood vessels with vascular endothelial cell. They are also useful for the induction of tissue growth and repair.

It allows vascular explants to be grown on a GDGF treated surface for implantation in a host. The sequence was isolated from the GS-9L rat cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Glioma-derived growth factor - stimulates mitogenesis of mammalian endothelial cells and is used in vitro or in vivo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8888888
                       The full length coding region of the A subunit or monomer of VEGF of setermined from three sets of overlapping CDMA clones. Degenerate oligo. primers based on the amino acid sequences

Phe-Met-Asp-Val-TyY-Gln from polypeptide L42 (residues 42-47) and CCys-Lys-Asn-Thr-Asp from polypeptide T38 (residues 164-168) were used to PCR amplify the central region of the CDNA for VEGF A chain.

A single band migrating at 420 bp was gel purified, digested with Sall, Ijated into pGEM3Zf(+) and sequenced. The nucleotide sequence cotained (p4238) was used to design antisense and sense PCR primers to amplify the 5, and 3, ends of the CDNA. These 5, and 3, clones are denoted p5-15 and pW3, respectively. In addition to the CDNA coding the 164 amino acid secreted form identified by protein sequencing, two alternatively spliced CDNAs encoding a 146 amino acid secreted CDNAs encoding a 146 amino acid forms are cloned and sequenced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             were isolated and sequenced using the Edman degradation reaction in a gas phase sequenator. In addition to the peptide fragments which were directly sequenced, the full-length protein sequence was deduced from the CDNA encoding it.
                                                                                                                                                                                                                                                                                               Vascular endothelial cell growth factor sub-units - which stimulate vascular endothelial cell growth, used for inducing tissue repair
                                                                                                                                                                                                                                                                                                                                                            WPI; 1992-325745/40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            EP506477-A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vascular development; mitogen; blood vessel; vascular endothelial growth factor; neovascularisation.

of the two protien subunitis isolated after reduction and carboxymethylation were each applied to polybrene-coated glass fiber filters and their N-terminal sequences were determined. The peak of absorbance eluting at approx 25 ml (A subunit) yielded an amino terminal sequence Ala Pro Thr Glu Gly Glu Gln Lys Ala His Glu Val Val identical to VEGF AA. The peak of absorbance eluting at approx. 3 ml (B subunit) yielded the N-terminal sequence Ala Gly Asn Xaa Ser Thr Glu Met Clu Val Val Pro Phe Asn Glu Val plus a hearly equal amount of a truncated form of the same corresp. to an Asn in the cloned sequence. The Asn and sum of the B chain peptides were recovered in nearly equal amounts supporting the interportation that the two peptides combine to form an AB heterodimer in VEGF II. The form of VEGF AB mature A subunit in the heterodimer is the 154 amino acid form. The form derived from 5 the 158 full length amino acid form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
